

# SEA-90 and Sea Water vs Low Sodium Competition

SEA-90 is produced from sea water, nothing added or removed. We cannot recreate the perfect sea water or create a higher quality sea water elementally or biologically in a lab. Sea water is proportionately very similar to human blood in elemental composition and human life begins floating in saline embryonic solution.

A primary principle of biology is: "The whole is greater than the sum of its parts". Each element or part represented in the periodic table must be present in exact proportions to support the role of all other elements.

Sea water is fractionally blended so even the most minute pinhead drop contains all periodic table elements, including sodium, in perfect ratios. Every periodic table element works together as a functional whole in sea water and SEA-90. If sodium is removed or reduced from this system, it disrupts the assimilation and use of other elements. Each element must function in ratio and relationship to all other elements in order for the natural delivery system to work.

Unfortunately, life outside the sea is not perfect or balanced. We live in a world of extremes, especially with regard to sodium. We hear and read that too much salt will kill us and too much salt in our soil will kill plants. This is true of processed salt containing 98-99 percent sodium chloride; excess in all things is bad, but the fact is that sodium and chloride are essential elements and deficiencies can and do exist. For example soils east of the Mississippi River receiving adequate rainfall have been shown to require additional sodium.

Fear is a very powerful marketing tool and SeaAgri's low sodium competitors are exploiting "fear of salt" to promote their products as being superior to SEA-90. They could not be further from the truth because we cannot improve sea water. What our competitors do not understand is that sodium must be present in the exact proportions as in sea water in order for the bio-availability of other minerals and trace elements. If we remove sodium, we create something unrelated to sea water that cannot deliver the complete mineral and trace element package SEA-90 provides.

SEA-90 is nature's perfect blend of balanced minerals and trace elements, sodium included, in the exact ratios and proportions of sea water.
